FROM THE HEART OF INDONESIA

The renovation interface for Asia.

Renovation is still sold as a bespoke project.
SECHA is building the product alternative.

One interface to configure the space. One job file to control the work. A material system that ships flat and assembles on site. Start in Indonesia; build the operating playbook that can travel across Asia.

US$300K	US$10K	30%
Historical project value served	Current minimum package	Fixed package gross margin

THE INVESTMENT THESIS

Keep the choice personal.
Make the scope, components and assembly repeatable.

Studio+ captures intent. Material development turns the scope into components. Flatpack packaging and modular assembly connect those components to a finished space. The aim is to replace repeated bespoke work with a product the business can deliver again.

Capital sought: US$1M
45% Product · 35% Materials & flatpack · 20% Distribution

Josephine Lovensa
Founder & CEO / Jakarta, Indonesia

Historical project value is company-reported and is not revenue. The current founder-defined policy sets a US$10,000 minimum package and a fixed 30% gross margin; this does not restate historical job margins. Material concepts and regional expansion are development objectives.

Start narrow.
Earn the right to expand.

PROPOSED BEACHHEAD / GREATER JAKARTA

Owner-occupiers upgrading a room or compact home.

A US$10,000 minimum package, a constrained scope and a customer at an existing property or financing decision. Property-agent and qualified-bank referrals are the proposed acquisition wedge; local supply density is the delivery advantage.

Bottom-up market model / planning assumptions

Annual eligible jobs × US$10,000	Annual project value
Indonesia / assumed 1,000,000 package jobs	US$10B
Greater Jakarta / assumed 50,000 package jobs	US$500M
Initial SECHA execution case / proposed 1,000 jobs	US$10M

The annual eligible-job volumes are explicit planning assumptions, not independently researched TAM/SAM figures. The execution case is 2% of the modelled Greater Jakarta volume. These figures are project value, not revenue or a market forecast, and require local demand validation.

Why this customer?

Renovation intent already exists. A contained upgrade is easier to scope and repeat than an open-ended bespoke project.

Why this geography?

A controlled delivery radius makes crew scheduling, supplier coordination, quality checks and referrals easier to measure.

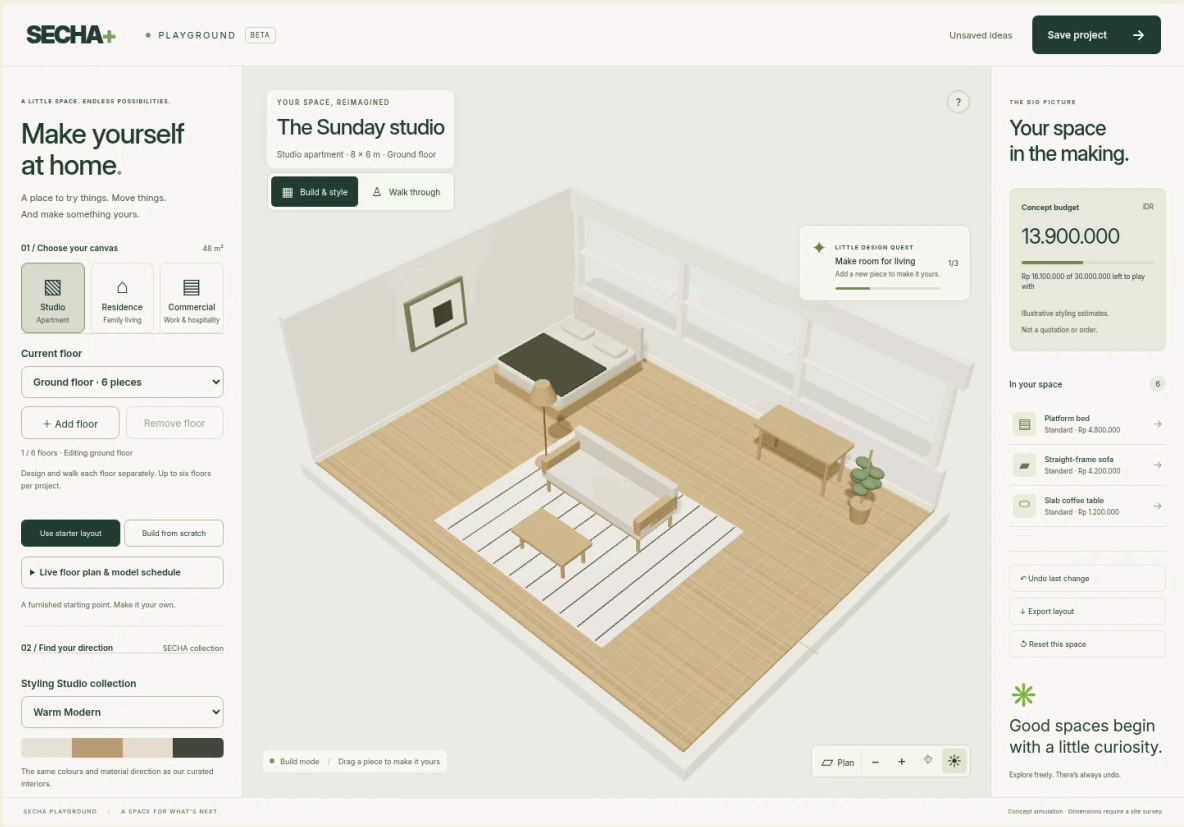

Existing-home context

The company update cites 82.38% household owner-occupancy and 68.72% adequate housing among urban households. They are contextual figures, not multipliers used to calculate the sizing model.

Source: supplied SECHA 2026 business update. The underlying statistical publications were not supplied or independently verified. No assumption is made that every inadequately housed household is a renovation customer.

The interface is taking shape. The delivery system completes it.

Studio+ supports 3D room exploration, furniture placement, material directions, floor controls, saved layouts and export. The next operating step is to connect that visible intent to a controlled job file.

Actual public Studio+ source rendered locally. Layouts and budgets are illustrative. The playground does not demonstrate live quoting, lending or fulfilment integrations.

The job file

Package scope, bill of materials, supplier allocation and installer sequence connect the decision to milestones, quality proof and margin control.

GX-100

GX-100 is part of a broader material and assembly system: composite components, flatpack packaging and defined installation sequences. The next chapter details EPS-core development.

Explore Studio+ / www.sechahome.com/studio/playground.html

Develop the material. Pack the renovation. Assemble the space.

SECHA's physical system is more than a snap panel. The development scope includes unconventional composite materials, repeatable components, flatpack packaging and a modular assembly sequence.

AI-generated material-development concept; not a completed build, fabrication drawing or certified product.

Wall panels

EPS cores, rigid facings, finished surfaces and repeatable connections. The wall system is developed as flat components with a defined assembly sequence.

Tables

EPS-core composite tops with engineered face sheets, reinforced edges and a supporting frame. Structural load paths belong to the frame and designed composite assembly.

Partitions

Framed EPS-core panels with finished faces, rigid bases and modular connections define rooms and zones within the same component system.

Specify → engineer → pack flat → assemble.

Final density, skins, adhesives, edge/frame design, spans, fasteners and site interfaces require prototypes and engineering. Applicable load, fire, impact, moisture and other performance requirements must be validated before release. No certification or performance rating is claimed by this image.

US$10,000 minimum.
30% gross margin. Always.

Every package is priced at a fixed 30% gross margin. The fulfilment budget is 70% of package value. Larger packages preserve the same percentage; contribution after acquisition and support is a separate metric.

Entry-package pricing rule	US$
Minimum package value	10,000
Fulfilment budget / 70%	– 7,000
Package gross profit / 30%	**3,000**

The fulfilment ledger needs to cover materials/components, factory preparation, installation, freight, quality and rework within the budget. No invented category-level actual cost schedule is presented.

Contribution sensitivity / illustrative defaults

Assumed acquisition cost / package	US$200
Assumed incremental sales/support / package	US$100
First-package contribution / 27%	**US$2,700**
Assumed fixed operating expense / month	US$20,000
Operating break-even	**8 jobs / month**

Cash timing

At a 50% deposit, US$5,000 is collected against US$7,000 fulfilment: a US$2,000 pre-final-payment delivery gap per package, or US$20,000 at ten concurrent jobs.

Higher-value example

A US$20,000 package has a US$14,000 fulfilment budget and US$6,000 gross profit. Gross margin remains 30%; at the same US$300 acquisition/support assumption, contribution is US$5,700.

CAC, support, overhead and deposit figures are assumptions, not operating actuals. Contribution = 30% × selected package value – CAC – incremental support. Break-even = ceiling(fixed overhead ÷ positive contribution). Delivery cash gap assumes all fulfilment is paid before final collection and no supplier credit; taxes, financing and other unprovided costs are excluded.

Win a package. Win a city. Repeat the playbook.

25

Standardised packages / cumulative validation

Prove scope, actual completed-job margin, rework, cycle time and customer referrals. Advance when the package economics are supported by evidence.

250

Packages / annual city-building pace

Build local crew density and a repeatable agent/bank referral loop. Advance when contribution stays positive after acquisition and support.

1,000

Packages / annual beachhead case

US$10M project value and US$3M gross profit at the fixed 30% gross margin. Prove capacity, quality and cash collection at higher throughput.

10,000

Packages / annual network scale case

The updated US$100M project-value / US$30M gross-profit illustration. Expand only when the next city can reproduce the package, channel and delivery economics.

Proposed underwriting gates and illustrative volume cases, not completed traction, dated forecasts or committed pipeline.

What compounds

Package intelligence improves the next scope. Local operating density improves coordination. Channel conversion and referrals reveal where the next job is cheapest to win.

The promised land

A regional renovation transaction and delivery layer: customers can see the outcome, understand the commitment and trust the process; the business can repeat its economics across packages and cities.

Josephine Lovensa.

Founder & CEO / SECHA

Second-time founder with scale-up experience and an exit. More than five years consulting on infrastructure projects across APAC. PropTech CEO of the Year 2026 — APAC Insider; Emerging Woman CEO in Real Estate 2024 — The Woman's Tabloid.

Antler **Startupbootcamp** **BonBillo**

Previous backers and support programmes confirmed by the founder. Cheque sizes, individual instruments and round terms were not supplied. Company recognition: DGEMS 2024 Select 200; the Forbes India / DGEMS profile and D Globalist listing concern the same recognition, not two funding events.

Raising US$1M.

Turn the founder-led service into a repeatable city operating model: connect Studio+ intent to job control, validate package economics and establish measurable distribution.

Planned use of funds	Allocation
Product / customer interface + controlled job files	45% · US$450K
Materials / EPS composites, flatpack and assembly	35% · US$350K
Distribution / agent + qualified-bank conversion	20% · US$200K
