FROM THE HEART OF INDONESIA

The renovation interface for Asia.

Make renovation a product.
Make the project legible to capital.

SECHA connects SECHA+ for the concept, modular packages for delivery and RenovaCredit for the financing workflow. We are raising US$1M to build RenovaCredit and prove the connected model in Greater Jakarta.

US$300K	US$10K	30%
Historical project value served	Current minimum package	Fixed package gross margin

THE INVESTMENT THESIS

A space you can configure.
A project capital can understand.

A defined package produces a scope and component list. RenovaCredit carries the budget, supporting evidence, owner decisions and review history. The same record should follow the project from the first choice to reconciled work.

Capital sought: US$1M
45% RenovaCredit product · 35% Materials & flatpack · 20% Distribution

Josephine Lovensa
Founder & CEO / Jakarta, Indonesia

Historical project value is company-reported and is not revenue. The current founder-defined policy sets a US$10,000 minimum package and a fixed 30% gross margin; this does not restate historical job margins. Material concepts and regional expansion are development objectives.

Start narrow.
Earn the right to expand.

PROPOSED BEACHHEAD / GREATER JAKARTA

Owner-occupiers upgrading a room or compact home.

A US$10,000 minimum package, a constrained scope and a customer at an existing property or financing decision. Property-agent and qualified-bank referrals are the proposed acquisition wedge; local supply density is the delivery advantage.

Bottom-up market model / planning assumptions

Annual eligible jobs × US$10,000	Annual project value
Indonesia / assumed 1,000,000 package jobs	US$10B
Greater Jakarta / assumed 50,000 package jobs	US$500M
Initial SECHA execution case / proposed 1,000 jobs	US$10M

The annual eligible-job volumes are explicit planning assumptions, not independently researched TAM/SAM figures. The execution case is 2% of the modelled Greater Jakarta volume. These figures are project value, not revenue or a market forecast, and require local demand validation.

Why this customer?

Renovation intent already exists. A contained upgrade is easier to scope and repeat than an open-ended bespoke project.

Why this geography?

A controlled delivery radius makes crew scheduling, supplier coordination, quality checks and referrals easier to measure.

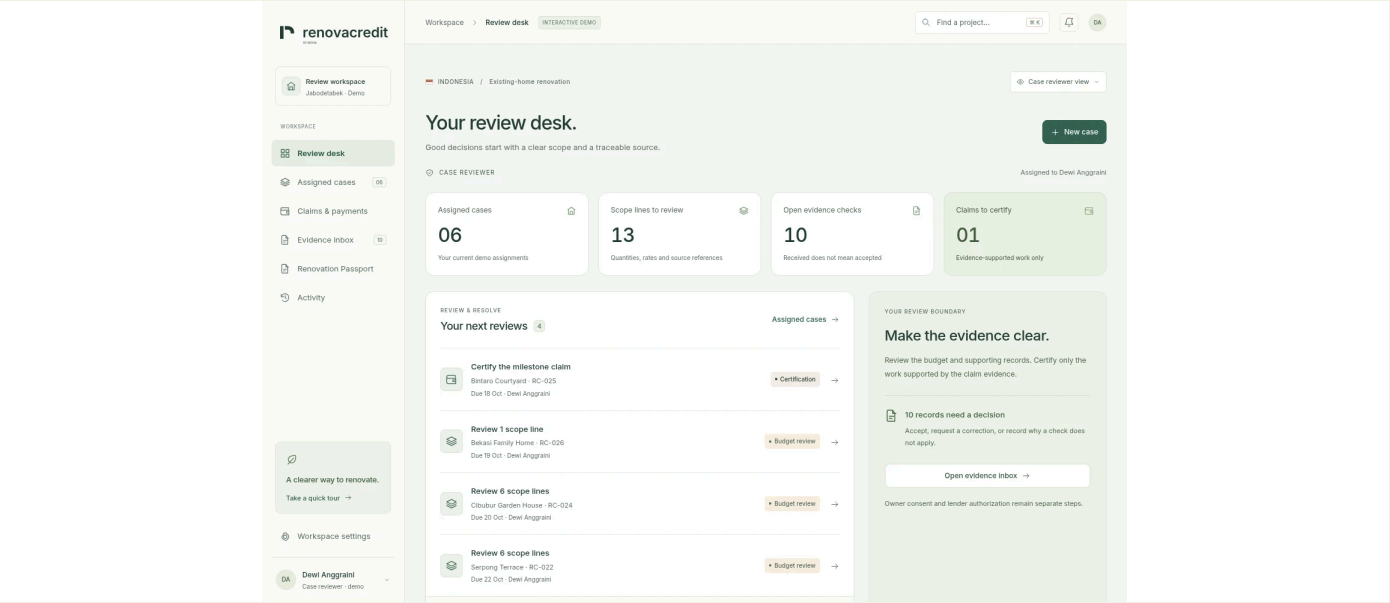

Existing-home context

The company update cites 82.38% household owner-occupancy and 68.72% adequate housing among urban households. They are contextual figures, not multipliers used to calculate the sizing model.

Source: supplied SECHA 2026 business update. The underlying statistical publications were not supplied or independently verified. No assumption is made that every inadequately housed household is a renovation customer.

A renovation project.
A record capital can read.

RenovaCredit connects what gets built with how it is funded. Scope, budget versions, supporting evidence, owner decisions and claims belong to the same project record.

Current product demonstration, rendered from the public source. All example records are fictional.

Define

Source-linked RAB lines, reviewed budget versions and owner decisions when scope changes.

Prepare

Separate project costs, owner cash and usable facilities. Prepare an evidence packet for review.

Reconcile

Separate certification, authorization, recorded payments and reconciliation. Preserve a Renovation Passport.

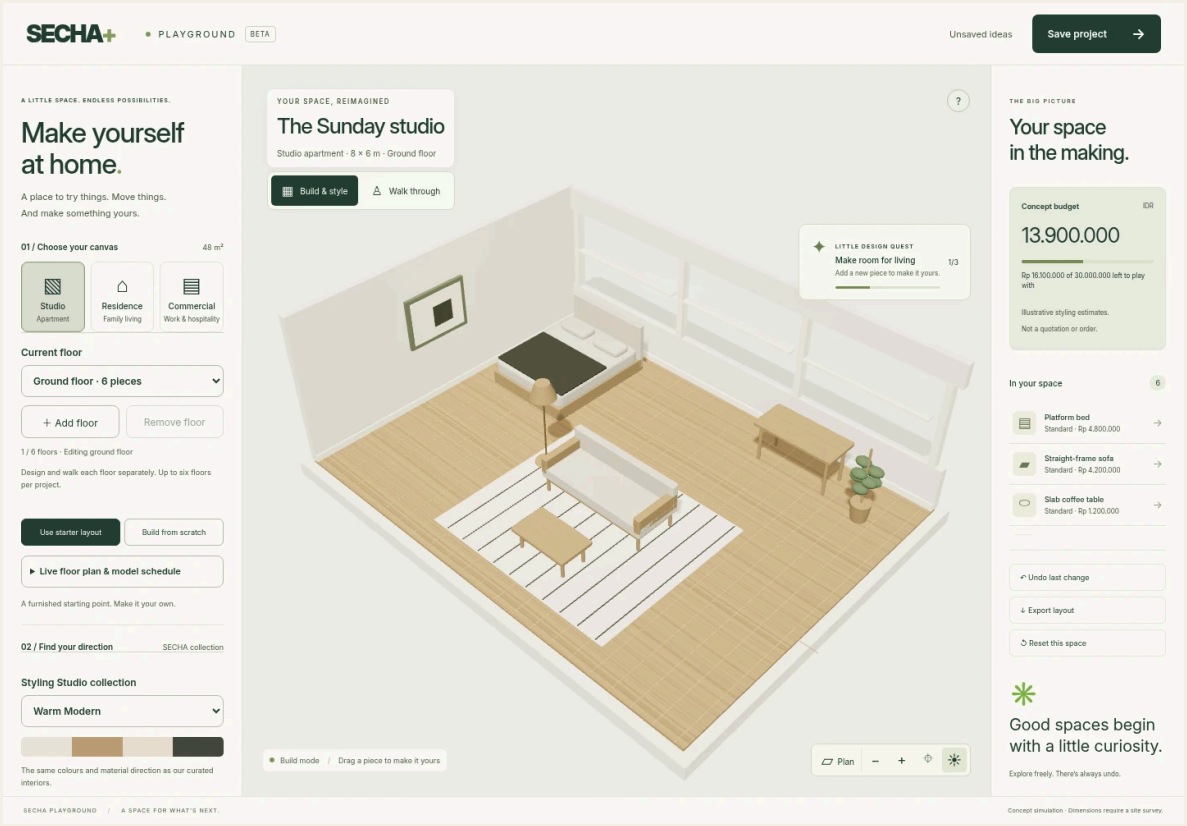

The commercial test: workflow subscriptions or per-case processing fees, initially for renovation operators handling repeated cases and financing handoffs. Pricing, willingness to pay and cost to serve remain pilot questions; no workflow revenue is included in the package model.

The demonstration does not approve credit, verify real documents or transfer funds. No live financing partnership, loan book or credit performance is claimed. Project-value scenarios elsewhere are renovation-throughput context, not software revenue or credit assets. The US$1M product-development raise is separate from future financing capital.

Explore RenovaCredit / jplovensa.github.io/SECHA-Credit-Engine/

The interface is taking shape. The delivery system completes it.

SECHA+ is the renovation playground: think The Sims for your space. Its Studio+ workspace supports 3D room exploration, furniture placement, material directions, floor controls, saved layouts and export. The next operating step is to connect that visible intent to a controlled job file.

Actual public Studio+ source rendered locally. Layouts and budgets are illustrative. The playground does not demonstrate live quoting, lending or fulfilment integrations.

The job file

Package scope, bill of materials, supplier allocation and installer sequence connect the decision to milestones, quality proof and margin control.

Snap panel

Snap panel is part of a broader material and assembly system: composite components, flatpack packaging and defined installation sequences. The next chapter details EPS-core development.

Explore Studio+ / www.sechahome.com/studio/playground.html

Develop the material.
Pack the renovation.
Assemble the space.

Snap panel is the starting component of SECHA's physical system. The development scope includes unconventional composite materials, repeatable components, flatpack packaging and a modular assembly sequence.

Material development concept; not a completed build, fabrication drawing or certified product.

Snap panel

EPS cores, rigid facings, finished surfaces and repeatable connections. The wall system is developed as flat components with a defined assembly sequence.

Tables

EPS-core composite tops with engineered face sheets, reinforced edges and a supporting frame. Structural load paths belong to the frame and designed composite assembly.

Partitions

Framed EPS-core panels with finished faces, rigid bases and modular connections define rooms and zones within the same component system.

Specify → engineer → pack flat → assemble.

Final density, skins, adhesives, edge/frame design, spans, fasteners and site interfaces require prototypes and engineering. Applicable load, fire, impact, moisture and other performance requirements must be validated before release. No certification or performance rating is claimed by this image.

Choose the outcome.
See the kit, cost and funding gap.

A constrained menu makes a renovation easier to specify, pack and review. These are illustrative development scopes and prices, subject to engineering, supplier and site validation.

Package	Example component scope	Price / gross profit
Room Refresh	8 Snap panels · 1 table	US$10,000 / US$3,000
Live + Work	12 Snap panels · 1 table · 1 partition	US$15,000 / US$4,500
Studio Reset	16 Snap panels · 2 tables · 2 partitions	US$20,000 / US$6,000

Sample scopes include finishes, kit logistics and standard installation. Add 4 panels for US$2,000; a table or partition kit for US$1,500; a bronze accent direction for US$1,000. Every configuration retains the fixed 30% gross-margin pricing rule.

Example: Live + Work, configured.

US$15,000 base + 4 panels (US$2,000) + 1 table (US$1,500) + bronze accent (US$1,000) = **US$19,500**. Component list: 16 panels, 2 tables, 1 partition. Fulfilment budget: US$13,650; gross profit: US$5,850. At 50% owner cash, the uncommitted funding gap is US$9,750.

A funding gap is not a loan offer. Rates, finance fees, lender commitments and approvals are not assumed. Use the interactive portal to change the configuration.

Material development required to ship the menu.

Snap panel: core/skin selection, bond quality, flatness, reinforced edges, connections and applicable fire/moisture validation.

Table: composite top bending, point loads, reinforced fixing points, frame stability and replaceable parts.

Partition: joints, base stability, tip-over/impact trials, repairability and applicable finish/fire requirements.

Complete kit: tolerances, supplier batches, packing and transit protection, site acceptance, assembly trials and actual cost capture.

No purchase or financing application is submitted. Final dimensions, taxes, exclusions and quotations need validation. Structural alterations, major MEP work and permit-related work are outside this sample menu.

From a material experiment to a renovation you can order.

Build a complete room kit: compatible parts, defined scope, a packing list and a repeatable assembly method. Each release earns the next; these are proposed gates, not committed dates.

01 / MATERIAL PLATFORM

Prove the composite.

Prototype Snap panel skins, EPS cores, edges and connections; develop supported tabletops and framed partitions. Gate: engineer-reviewed specifications and applicable load, fire, moisture and durability testing before release.

02 / COMPONENT LIBRARY

Make the parts compatible.

Version module sizes, frames, bases, connectors, finishes, tolerances, suppliers and replacement parts. Gate: repeatable fit, costed bills of materials and documented assembly trials.

03 / PILOT ROOM KIT

Ship one complete renovation.

Pilot constrained room scopes in Greater Jakarta with labelled flatpacks, packing lists, tools, site requirements and installer sequences. Gate: validate damage, missing parts, assembly time, snagging and actual costs against the 70% fulfilment budget.

04 / CONFIGURABLE CATALOGUE

Turn play into a package.

Connect approved SECHA+ choices to compatible kits, controlled job files and order-ready scopes. Gate: reconcile concept, component list, price and installed result at a US$10,000 minimum and fixed 30% gross margin.

A configured space + a defined kit + flatpack delivery + repeatable installation.

No engineering validation, live concept-to-order integration or completed roadmap milestones are asserted.

US$10,000 minimum. 30% gross margin. Always.

Every package is priced at a fixed 30% gross margin. The fulfilment budget is 70% of package value. Larger packages preserve the same percentage; contribution after acquisition and support is a separate metric.

Entry-package pricing rule	US$
Minimum package value	10,000
Fulfilment budget / 70%	– 7,000
Package gross profit / 30%	**3,000**

The fulfilment ledger needs to cover materials/components, factory preparation, installation, freight, quality and rework within the budget. No invented category-level actual cost schedule is presented.

Contribution sensitivity / illustrative defaults

Assumed acquisition cost / package	US$200
Assumed incremental sales/support / package	US$100
First-package contribution / 27%	**US$2,700**
Assumed fixed operating expense / month	US$20,000
Operating break-even	**8 jobs / month**

Cash timing

At a 50% deposit, US$5,000 is collected against US$7,000 fulfilment: a US$2,000 pre-final-payment delivery gap per package, or US$20,000 at ten concurrent jobs.

Higher-value example

A US$20,000 package has a US$14,000 fulfilment budget and US$6,000 gross profit. Gross margin remains 30%; at the same US$300 acquisition/support assumption, contribution is US$5,700.

CAC, support, overhead and deposit figures are assumptions, not operating actuals. Contribution = 30% × selected package value − CAC − incremental support. Break-even = ceiling(fixed overhead ÷ positive contribution). Delivery cash gap assumes all fulfilment is paid before final collection and no supplier credit; taxes, financing and other unprovided costs are excluded.

Win a package. Win a city. Repeat the playbook.

25

Standardised packages / cumulative validation

Prove scope, actual completed-job margin, rework, cycle time and customer referrals. Advance when the package economics are supported by evidence.

250

Packages / annual city-building pace

Build local crew density and a repeatable agent/bank referral loop. Advance when contribution stays positive after acquisition and support.

1,000

Packages / annual beachhead case

US$10M project value and US$3M gross profit at the fixed 30% gross margin. Prove capacity, quality and cash collection at higher throughput.

10,000

Packages / annual network scale case

The updated US$100M project-value / US$30M gross-profit illustration. Expand only when the next city can reproduce the package, channel and delivery economics.

Proposed underwriting gates and illustrative volume cases, not completed traction, dated forecasts or committed pipeline.

What compounds

Package intelligence improves the next scope. Local operating density improves coordination. Channel conversion and referrals reveal where the next job is cheapest to win.

The promised land

A regional renovation transaction and delivery layer: customers can see the outcome, understand the commitment and trust the process; the business can repeat its economics across packages and cities.

Josephine Lovensa.

Founder & CEO / SECHA

Second-time founder with scale-up experience and an exit. More than five years consulting on infrastructure projects across APAC. PropTech CEO of the Year 2026 — APAC Insider; Emerging Woman CEO in Real Estate 2024 — The Woman's Tabloid.

Antler **Startupbootcamp** **BonBillo**

Previous backers and support programmes confirmed by the founder. Cheque sizes, individual instruments and round terms were not supplied. Company recognition: DGEMS 2024 Select 200; the Forbes India / DGEMS profile and D Globalist listing concern the same recognition, not two funding events.

Raising US$1M.

Build RenovaCredit into a secure project-and-finance workflow. Validate it with modular renovation packages in Greater Jakarta and prove a repeatable partner channel. This is product-development capital; any lending facility requires separate capital and partner agreements.

Planned use of funds	Allocation
RenovaCredit / project records, evidence and finance handoffs	45% · US$450K
Materials / EPS composites, flatpack and assembly	35% · US$350K
Pilot & partners / workflow adoption and willingness to pay	20% · US$200K
